

## Interfacing to the Handy Board with RoboJDE™

**Buzzer**

```
void beep()
void click()
void play(int frequency, int duration)
Speaker getBuzzer()
void speaker.beep()
void speaker.click()
void speaker.play(int frequency, int duration)
```

**Host Output**

```
void System.out.println(String text)
void System.err.println(String text)
void exception.printStackTrace()
OutputStream VM.getDebugOutputStream()
```

**Motor Ports**

```
void setMotorPower(int motor, int power)
Motor getMotor(int motor)
void motor.setPower(int power)
```

**Servo Ports**

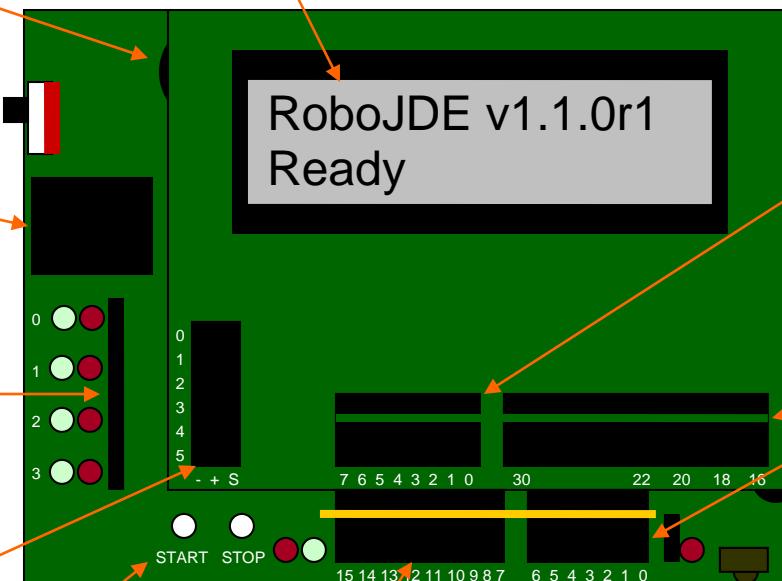

```
void setServoPosition(int servo, int position)
Servo getServo(int servo)
void servo.setPosition(int position)
Motor new ContinuousRotationServo(...)
void motor.setPower(int power)
```

**Start and Stop Buttons**

```
boolean startPressed()
boolean stopPressed()
void setTerminateOnStop(boolean terminateAppOnStop)
PushButton getStartButton()
PushButton getStopButton()
boolean button.isPressed()
void button.waitReleased()
```

### LCD Display

```
void System.out.println(String text)
void System.err.println(String text)
void System.setOut(PrintStream newOut)
void System.setErr(PrintStream newErr)
OutputStream getOutputStream()
Display getLCDDisplay()
void display.print(int line, String string)
boolean display.printChar(int line, int column, byte character)
```

### Digital Inputs

```
boolean isDigitalInputSet(int portNumber)
DigitalInput getDigitalInput(int portNumber)
```

### 7 & 8 only -> pulse measurement

```
void enablePulseMeasurement(int port, boolean enabled)
int readPulseDuration(int port)
```

### 10 – 15 only -> shaft encoding

```
void enableEncoder(int encoder)
int getEncoderCounts(int encoder)
int getEncoderRate(int encoder)
ShaftEncoder getShaftEncoder(int encoder)
int encoder.getCounts()
int encoder.getRate()
```

### 9 only -> can be DigitalOutput #9

```
void setDigital9Direction(boolean isOutput)
```

### Misc

```
void setBoardType(byte type)
byte getBoardType()
long System.currentTimeMillis()
void Thread.sleep(long milliseconds)
```

### Digital Outputs

```
void clearDigitalOutput(int portNumber)
void setDigitalOutput(int portNumber)
void toggleDigitalOutput(int portNumber)
void pulseDigitalOutput(int portNumber, int duration)
boolean isDigitalOutputSet(int portNumber)
DigitalOutput getDigitalOutput(int output)
void digitalOutput.clear()
void digitalOutput.set()
void digitalOutput.toggle()
boolean digitalOutput.isSet()
void pulseOutput.pulse(int duration)
```

### Analog Inputs

```
int analog(int portNumber)
AnalogInput getAnalogInput(int portNumber)
int analogInput.sample()
```

### Thumbwheel

```
int readThumbWheel()
AnalogInput getThumbWheel()
int thumbWheel.sample()
```

### IR Demodulator

```
void irRxInitialize(...)
int irRead()
IrReceiver getIrReceiver()
IrRemote new SonyIrRemote(IrReceiver irReceiver)
IrRemote new Mvp1IrRemote(IrReceiver irReceiver)
int irRemote.read()
```

### Notes

- Unless noted otherwise, all methods are static and should be preceded by "HandyBoard." For example, `boolean HandyBoard.startPressed()`.
- See RoboJDE API documentation for more detailed information.
